This is a simple socket/messaging program where messages are sent from one
client to many clients...a publish and subscribe type mechanism.  Clients can
quite the program simply by typing 'quit'.  By typing 'quit' on the Server
prompt, the entire process will shutdown including connected clients.

To run the program, do the following:

1.  Open a command prompt and type:  java Server
2.  Follow the instructions
3.  Open another command prompt and type:  java Client "Client Name"
4.  Follow the instructions

Look at the code for documentation.

Enjoy!
